

Testosterone & Protein

Aim

- To increase the production of testosterone & Protein in the human body as well as the intake of it but decrease the potential side effects on the body.
- Create a drug that helps improve and increase the muscles of a person
- Meant to be taken in moderation to not cause radical changes
- Supplement to help. Not do the job

Foods

- There are several food ingredients that have been suggested to increase testosterone levels. Tuna meat has been shown to increase testosterone hormone levels in men when consumed as a supplement ^[1]. Onions have also been found to enhance testosterone levels in males by increasing the production of luteinizing hormone and enhancing antioxidant defense mechanisms ^[2]. Additionally, a food composition containing a *Cynanchum wilfordii* Hemsley extract has been shown to enhance testosterone secretion ^[3]. A composition of grape seed extract and black tea extract has also been found to increase testosterone secretion more effectively than a single component ^[4]. These findings suggest that certain foods and food ingredients may have the potential to regulate and increase testosterone levels. However, further research, including clinical trials, is needed to validate these findings

- Testosterone is produced by the gonads (by the Leydig cells in testes in men and by the ovaries in women), although small quantities are also produced by the adrenal glands in both sexes.

Gonads

Adrenal

Foods

- Protein intake can be increased through various food sources. Plant-based proteins, such as grains and legumes, are economical and can be integrated into diets to improve protein quality and nutrient intake ^[1]. Extrusion processes can be used to create high-protein foods using acid casein and whey protein ^[2]. Protein enrichment of familiar foods and drinks can also be effective in increasing protein intake, particularly in older adults ^[3]. Meat-based high-protein foods can be prepared using specific methods, resulting in easily digestible and nutritious products ^[4]. Additionally, high-protein snack foods can be made using fish ball wrappers and cores, providing a protein-rich and flavorful option

- The secreted class contains many of the most abundantly expressed genes and the highest expression levels of secreted proteins are found in pancreas and salivary gland.
